

The Design Consistency Sweep, *explained with pictures*

What I checked across the Mom section of your app, what was slightly off, and what each fix changed — shown side by side.

I. The little ">" arrows were three different sizes

Every tappable row in the app ends with a small chevron. The design rules call for one size everywhere — 16px. Home screen had four rows at 17px, and the Birth Plan screen had one big 22px leftover.

Rule: standard row arrows = 16px, gray #B9AFB8 (rose on rose rows). "My Tools" 20px arrow = locked S10 approval, untouched.

2. "This week" ring on Weekly Tips didn't match the approved mockup

On Weekly Tips, the current week gets a highlighted chip. The approved design shows a solid rose ring. The app had a faded, washed-out ring instead.

Before: dashed pale ring (#EFE0EB border instead of #B085A5). Reads as "disabled," not "you are here." (Shipped code had the solid ring at a lighter token — shown dashed here to make the difference visible at packet size.)

border C.roseSoft
pale — old

border C.roseBorder
solid — approved

After: solid rose ring exactly as the approved September 18 design (mockup .wk.cur: ring #B085A5, blush fill #FBF5F9, rose number). Now matches the timer's "current lap" and My Team's status chips.

Why it matters: "you are here" markers should look the same everywhere in the app — week 27 ring, active timer lap, current status chip. One ring, one meaning.

Approved mockup law: .wk.cur = border #B085A5 (roseBorder) + fill #FBF5F9 (gbandMid) + rose number. The old border color is still correct for chips that are NOT "current" — it just never belonged on this one.

3. Nine icons existed in the app but were missing from the design binder

The app's icon set (left artwork) was missing nine glyphs from the design documentation copy — every icon the app actually draws, including these, is now recorded. The app itself never showed a wrong icon; this was bookkeeping so future screens (and other designers/agents) pull from the same complete set.

The nine: History (archive shelf) · Add (plus) · Share (arrow out of tray) · Settings (gear) · Timeline (arch) · Notifications (bell) · Contract (document with seal) · Invoice (document with lines) · Invoice Paid (check circle). Drawn at 24×24, 1.7 stroke — same hand-drawn thin-line style as the rest of the set.

Also cleaned: two small code-hygiene items that kept the build green — a dead import removed, and a style property that used a web-only spelling corrected to the app's valid spelling (`translate` → `translateY` , used for a half-pixel optical alignment on My Team's status chips).

Source of truth: `tlcon.tsx` (what the app renders) ↔ `icons.mjs` (design binder). Now 31/31, verified programmatically.

4. What the sweep checked and found already clean

The double-check covered every redesigned Mom screen — Home, Timer, Weekly Tips, Birth Plan, Appointments, My Team, Messages — against the approved specs. Most of it passed; the three pages above were the only drift found.

What was checked	How it was checked	Result
Colors	Every color value on all 7 redesigned screens scanned against the approved palette (cream, lavender, rose, sage, ink, gray — no banned bright-violet)	✓ 0 off-palette
Icons	All icons on redesigned screens come from the custom TIcon set — no leftover library icons on those surfaces	✓ 0 legacy icons
Headers	Cormorant serif titles + overline labels, consistent across surfaces	✓ consistent
Type ramp	Sizes/weights from the approved type system on every redesigned surface	✓ consistent
Chips & rings	Current-week chip was the one drift (page 2); other status chips already on spec	✓ fixed, then verified
Build	Full app typecheck after all edits	✓ 0 errors

One honest scope note: three places inside Messages (the chat view once you open a conversation, the “new message” window, and error screens) still use the older, pre-refresh icon style. That’s deliberate — no approved mockups exist for those sub-screens yet, and the rule is mockup-first: nothing gets redesigned freehand. They’re logged as waiting-for-mockups.
